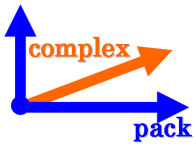
complexpack user manual



Title	complexpack (VHDL complex arithmetic package).
Author	Nikolaos Kavvadias 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016
Contact	nikos@nkavvadias.com
Website	http://www.nkavvadias.com
Release Date	13 March 2016
Version	0.1.4
Rev. history	
v0.1.4	2016-03-13 Update date information.
v0.1.3	2014-11-30 Added project logo to README.rst.
v0.1.2	2014-06-17 Changed README to README.rst.
v0.1.1	2014-03-04 Added support for the "abs" and the negation ("-") operators as those are needed by the complexarrpack package project.
v0.1.0	2014-03-03 Added get_real, get_imaginary, magnitude, and operators: lt, gt, le, ge, eq, ne. New library dependency: IEEE.math_real.
v0.0.1	2014-02-24 Changed documentation format to RestructuredText. Code has been reorganized into new directory structure.
v0.0.0	2009-10-02 First public release.

1. Introduction

`complexpack` is a simple complex arithmetic package written in VHDL. It is based ona code example present in the RASSP series of VHDL lectures. Compared to the RASSP version, the following have beed added:

- conjugate function.
- magnitude function.
- comparison operators.
- get real and get imaginary part functions.

A complex number is defined by the pair (real-part, imaginary-part) where both items of the pair are numbers. A common algebraic representation for complex numbers is:

```
z = a + i*b,
```

where:

- `z` is the resulting complex number
- `a` is the real part of the number also written as `a = Re(z)`
- `b` is the imaginary part of the number also written as `b = Im(z)`
- `i` is the imaginary unit and has the value of `sqrt(-1)`.

Currently, the `complexpack` package implements the following:

- the constants re and im, which specify addresses for an array-based representation of a complex number
- type definition for a complex number
- interface and implementation for complex arithmetic functionality

1.1. Implemented functions and operators

This is a summary of the currently supported functions, procedures and operators by the `complexpack` package.

- `to_complex(real, real)`: form a complex number
- `+`: add two complex numbers
- `-`: subtract one complex number from another
- `-`: negate a complex number
- `*`: multiply two complex numbers
- `/`: divide two complex numbers
- `conjugate(complex)`: return the conjugate of the given complex number

All functions above return an item of the complex data type.

- `get_real(complex)`: get the real part of a complex number
- `get_imaginary(complex)`: get the imaginary part of a complex number

- `magnitude(complex)`: return the magnitude (distance of point 0,0) of the complex number
- `abs(complex)`: alias for `magnitude`

All functions above return an item of the real data type (a scalar quantity).

- <: less than comparison for two complex numbers
- >: greater than comparison for two complex numbers
- <=: less than or equal comparison for two complex numbers
- >=: greater than or equal comparison for two complex numbers
- =: equality comparison for two complex numbers
- /=: non-equality comparison for two complex numbers

All functions above return an item of the boolean data type (TRUE or FALSE).

The definition of `magnitude` requires a square root computation. For this task, a call to the `sqrt` function found in the `IEEE.math_real` library is used.

`complexpack` is distributed along with a simple VHDL testbench exercising basic functionalities.

2. File listing

The `complexpack` distribution includes the following files:

/complexpack	Top-level directory
AUTHORS	List of `complexpack` authors.
BUGS	Bug list.
ChangeLog	A log for code changes.
LICENSE	The LGPL, version 3, governs `complexpack`.
README.rst	This file.
README.html	HTML version of README.rst.
README.pdf	PDF version of README.rst.
THANKS	Acknowledgements.
TODO	A list of future enhancements.
VERSION	Current version of the project sources.
complexpack.png	PNG image for the `complexpack` project logo.
rst2docs.sh	Bash script for generating the HTML and PDF versions.
/bench/vhdl	Benchmarks VHDL directory
complexpack_tb.vhd	A simple testbench.
/doc	Documentation directory
/rtl/vhdl	RTL source code directory for the package
complexpack.vhd	The complex arithmetic package.
/sim/rtl_sim	RTL simulation files directory

/sim/rtl_sim/out	RTL simulation output files directory
complexpack_results-.txt	Output generated by the `complexpack_tb.vhd` test.
/sim/rtl_sim/run	RTL simulation run scripts directory
complexpack.mk	GNU Makefile for running GHDL simulations.
run.sh	A bash script for running the GNU Makefile for GHDL.

3. `complexpack` usage

The `complexpack` package test script can be used as follows:

```
$./run.sh
```

as run from within the `./sim/rtl_sim/run` subdirectory.

After this process, the `complexpack_results.txt` file is generated containing simulation results.

4. Prerequisites

- Standard UNIX-based tools (tested on cygwin/x86 and MinGW/x86 and MinGW/x64)
  - make
  - bash
- GHDL simulator (http://ghdl.free.fr)

  Provides the "ghdl" executable and corresponding simulation environment. Versions throughtout 0.26 to 0.31 (mcode) have been used for testing.
