

# complexpack user manual

<b>Title</b>	complexpack (VHDL complex arithmetic package).
<b>Author</b>	Nikolaos Kavvadias 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017
<b>Contact</b>	<a href="mailto:nikolaos.kavvadias@gmail.com">nikolaos.kavvadias@gmail.com</a>
<b>Website</b>	<a href="http://www.nkavvadias.com">http://www.nkavvadias.com</a>
<b>Release Date</b>	05 June 2017
<b>Version</b>	0.2.0
<b>Rev. history</b>	
<b>v0.2.0</b>	2017-06-05 Add polar form, to_polar, to_cartesian, exp, log, pow, sqrt, sin, cos, tan, arcsin, arccos, arctan.
<b>v0.1.5</b>	2016-23-07 Use sim/rtl_sim/bin dir, ignores for git, clean script
<b>v0.1.4</b>	2016-03-13 Update date information.
<b>v0.1.3</b>	2014-11-30 Added project logo to README.rst.
<b>v0.1.2</b>	2014-06-17 Changed README to README.rst.
<b>v0.1.1</b>	2014-03-04 Added support for the "abs" and the negation ("-") operators as those are needed by the complexarrpack package project.
<b>v0.1.0</b>	2014-03-03 Added get_real, get_imaginary, magnitude, and operators: lt, gt, le, ge, eq, ne. New library dependency: IEEE.math_real.
<b>v0.0.1</b>	2014-02-24 Changed documentation format to RestructuredText. Code has been reorganized into new directory structure.
<b>v0.0.0</b>	2009-10-02 First public release.

# 1. Introduction

`complexpack` is a simple complex arithmetic package written in VHDL. It is based on a code example present in the RASSP series of VHDL lectures. Compared to the RASSP version, the following have been added:

- conjugate function.
- magnitude function.
- comparison operators.
- get real and get imaginary part functions.

A complex number is defined by the pair (real-part, imaginary-part) where both items of the pair are numbers. A common algebraic representation for complex numbers is:

$$z = a + i*b,$$

where:

- $z$  is the resulting complex number
- $a$  is the real part of the number also written as  $a = \text{Re}(z)$
- $b$  is the imaginary part of the number also written as  $b = \text{Im}(z)$
- $i$  is the imaginary unit and has the value of  $\sqrt{-1}$ .

Currently, the `complexpack` package implements the following:

- the constants `re` and `im`, which specify addresses for an array-based representation of a complex number
- type definition for a complex number
- interface and implementation for complex arithmetic functionality

## 1.1. Implemented functions and operators

This is a summary of the currently supported functions, procedures and operators by the `complexpack` package.

- `to_complex(real, real)`: form a complex number
- `+`: add two complex numbers
- `-`: subtract one complex number from another
- `-`: negate a complex number
- `*`: multiply two complex numbers
- `/`: divide two complex numbers
- `conjugate(complex)`: return the conjugate of the given complex number

- `exp`: return the complex exponent
- `log`: return the complex logarithm
- `pow`: return the complex power
- `sqrt`: return the complex square root
- `sin`: return the complex sine
- `cos`: return the complex cosine
- `tan`: return the complex tangent
- `arcsin`: return the complex arcsine
- `arccos`: return the complex arccosine
- `arctan`: return the complex arctangent

All functions above return an item of the complex data type.

- `get_real(complex)`: get the real part of a complex number
- `get_imaginary(complex)`: get the imaginary part of a complex number
- `magnitude(complex)`: return the magnitude (distance of point 0,0) of the complex number
- `abs(complex)`: alias for `magnitude`

All functions above return an item of the real data type (a scalar quantity).

- `<`: less than comparison for two complex numbers
- `>`: greater than comparison for two complex numbers
- `<=`: less than or equal comparison for two complex numbers
- `>=`: greater than or equal comparison for two complex numbers
- `=`: equality comparison for two complex numbers
- `/=`: non-equality comparison for two complex numbers

All functions above return an item of the boolean data type (TRUE or FALSE).

- `to_polar`: convert the complex (Cartesian) to polar coordinates

The function above returns a complex number in polar form.

The definition of `magnitude` requires a square root computation. For this task, a call to the `sqrt` function found in the `IEEE.math_real` library is used.

`complexpack` is distributed along with a simple VHDL testbench exercising basic functionalities.

## 2. File listing

The `complexpack` distribution includes the following files:

/complexpack	Top-level directory
AUTHORS	List of complexpack authors.
BUGS	Bug list.
ChangeLog	A log for code changes.
LICENSE	The LGPL, version 3, governs complexpack.
README.rst	This file.
README.html	HTML version of README.rst.
README.pdf	PDF version of README.rst.
THANKS	Acknowledgements.
TODO	A list of future enhancements.
VERSION	Current version of the project sources.
complexpack.png	PNG image for the complexpack project logo.
rst2docs.sh	Bash script for generating the HTML and PDF versions.
/bench/vhdl	Benchmarks VHDL directory
complexpack_tb.vhd	A simple testbench.
/doc	Documentation directory
/rtl/vhdl	RTL source code directory for the package
complexpack.vhd	The complex arithmetic package.
/sim/rtl_sim	RTL simulation files directory
/sim/rtl_sim/bin	RTL simulation makefiles directory
complexpack.mk	GNU Makefile for running GHDL simulations.
/sim/rtl_sim/out	RTL simulation output files directory
complexpack_results- .txt	Output generated by the complexpack_tb.vhd test.
/sim/rtl_sim/run	RTL simulation run scripts directory
clean.sh	A bash script for cleaning simulation artifacts.
run.sh	A bash script for running the GNU Makefile for GHDL.

### 3. complexpack usage

The complexpack package test script can be used as follows:

```
$ ./run.sh
```

as run from within the `./sim/rtl_sim/run` subdirectory. The run script expects that the GHDL simulator is installed and its `bin` directory is in the `$PATH`.

After this process, the `complexpack_results.txt` file is generated containing simulation results.

A reference `complexpack_results.txt` is kept under `./sim/rtl_sim/out` for comparison.

To clean up afterwards, use:

```
$ ./clean.sh
```

## 4. Prerequisites

- Standard UNIX-based tools (tested on cygwin/x86 and MinGW/x86 and MinGW/x64)
  - make
  - bash
- GHDL simulator (<http://ghdl.free.fr>)

Provides the "ghdl" executable and corresponding simulation environment. Versions throughout 0.26 to 0.33 have been used for testing.
